There are two main design cases for internal yield pressure of production casing. One is modeled with a tubing leak near the surface with the shut-in tubing pressure added to the packer fluid weight as an internal load. The shut-in tubing pressure is estimated from the bottom hole pressure minus the weight of the gas in the tubing.

Oil casing is the lifeline to maintain the operation of oil wells. Due to different geological conditions, the downhole stress state is complex, and the combined action of tensile, compressive, bending and torsion stresses on the pipe body, which puts forward higher requirements on the quality of the casing itself.

Production tubing is typically anywhere from 1 7/8" to 2 7/8" wide. This is literally a string of tubing that is lowered into the well by a workover rig later in the well's life. Some companies even just install production tubing before they begin producing the well so that it won't lose its ability to lift fluid naturally as soon.
